A GPU-powered Computational Framework for Efficient 3D Model-based Vision

Nikolaos Kyriazis, Iason Oikonomidis, Antonis A. Argyros

Institute of Computer Science, FORTH, Greece AND Department of Computer Science, University of Crete, Greece

PROBLEM

Provide efficient implementations for hypothesize-and-test vision methods that incorporate intense rendering as means of simulation.

MOTIVATION

In computer vision, several problems are solved by employing hypothesize-and-test methods. Hypotheses can be made comparable to acquired images by means of 3D rendering.

MAIN IDEA

- **3D rendering** is an inherently parallel process that is delegated to parallel hardware (GPUs)
- Parallel test/comparison criteria constitute the dominant case
- Exploitation of GPUs beyond traditional 3D rendering to satisfy the challenging computational demands of 3d model-based vision methods

METHOD

Geometries

Transforms T0

rojections

Observations

Viewports V0

Data upload	Data explosion Geometry Instancing	Vertex Processing	Pixel processing Multi-viewport clipping
G0 T0 T1 T2 T3 P0 ns 00 V0 V1 V2 V3	$ \begin{array}{c} G0 \ \begin{tabular}{c} \hline 0 \ \begin{tabular}{c} 0 \ \begin \ \begin \ \begin{tabular}{c} 0 \ \begin{tabular}{c} 0 \ $		

The tiled rendering process. Unique data are uploaded to the GPU, exploded into a tiled plan, processed in the vertex level and output in primary maps for later processing. Although there might be overlap of projected geometry across tiles during vertex processing this is remedied at the pixel-processing stage.

Input Observations/Hypotheses	Operand textures Implicit/Explicit	Differentiation	Reduction
SUO			

APPLICATIONS

Tracking of "kinematic forests"

3D hand tracking from multiple cameras [1,2] (2 fps for 4 cameras)

The differentiation process. Primary maps are mapped to the observations' feature space. Observations are implicitly tiled so as to match the tiled rendering of all hypotheses. A pixel wise differentiation is applied and the result is finally summed over the logical tiles by means of subsampling (data implosion).

3D hand tracking from Kinect [1,3] (15 fps for 1 sensor)

3D hand-object tracking from multiple cameras [1,4] (2 fps for 4 cameras)
